(a)
$\lambda_c = 0.512$
$N \to \infty$, $\langle a \rangle \neq 0$ (= Eq. 4.54): stable
unstable
$N \to \infty$, $\langle a \rangle = 0$ imposed
$N = 15$, $\langle a \rangle \neq 0$ with $1/N$ terms
trajectories N = 15: below threshold ($t = t_{max}$)
trajectories N = 15: lobe
$\langle a^\dagger a \rangle / N$
$\lambda$
(b)
trajectories N = 15
$\langle a \rangle \neq 0$ Gaussian, $N = 15$
coherent state $\sqrt{\langle n \rangle}/N$
lobe width $\sigma_n/N$
$\lambda$
(c)
vs $N \to \infty$ (Eq. 4.54)
vs $\langle a \rangle \neq 0$, $N = 15$
data / theory − 1 [%]
$\lambda$
